²⁾ Supply voltages higher than $V_{bb(\text{AZ})}$ require an external current limit for the GND and status pins, e.g. with a $150\ \Omega$ resistor in the GND connection and a $15\text{ k}\Omega$ resistor in series with the status pin. A resistor for the protection of the input is integrated.

⁷⁾ Add I_{ST} , if $I_{ST} > 0$, add I_{IN} , if $V_{IN} > 5.5\text{ V}$

⁸⁾ Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

⁹⁾ Short circuit current limit for max. duration of $t_{d(SC)}$ max=450 μs , prior to shutdown

¹⁰⁾ Requires 150 Ω resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 2 and circuit page 7).

Terms

Input circuit (ESD protection)

ZD11 6 V typ., ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

¹²⁾ Power Transistor off, high impedance.

¹³⁾ Low resistance short V_{bb} to output may be detected in ON-state by the no-load-detection

Status output

ESD-Zener diode: 6 V typ., max 5 mA;
 $R_{ST(ON)} < 250 \Omega$ at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions.
 Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Short circuit detection

Fault Condition: $V_{ON} > 8.5 \text{ V typ.}$; IN high

Inductive and overvoltage output clamp

V_{ON} clamped to 68 V typ.

Overvolt. and reverse batt. protection

$V_{Z1} = 6.2 \text{ V typ.}$, $V_{Z2} = 70 \text{ V typ.}$, $R_{GND} = 150 \Omega$, R_{IN} , $R_{ST} = 15 \text{ k}\Omega$

Open-load detection

ON-state diagnostic condition: $V_{ON} < R_{ON} \cdot I_{L(OL)}$; IN high

GND disconnect

Any kind of load. In case of Input=high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$.
 Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

GND disconnect with GND pull up

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off
Due to $V_{GND} > 0$, no V_{ST} = low signal available.

Vbb disconnect with energized inductive load

Normal load current can be handled by the PROFET itself.

Vbb disconnect with charged external inductive load

If other external inductive loads L are connected to the PROFET, additional elements like D are necessary.

Inductive Load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for $R_L > 0 \Omega$:

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} \cdot (V_{bb} + |V_{OUT(CL)}|) \cdot \ln \left(1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

Maximum allowable load inductance for a single switch off

$L = f(I_L)$; $T_{j,start} = 150^\circ\text{C}$, $T_C = 150^\circ\text{C}$ const.,

$V_{bb} = 12\text{ V}$, $R_L = 0 \Omega$

L [mH]

Typ. transient thermal impedance chip case

$$Z_{thJC} = f(t_p, D), D = t_p/T$$

 $Z_{thJC} [K/W]$
