NDS336P**P-Channel Logic Level Enhancement Mode Field Effect Transistor****General Description**

SuperSOT™-3 P-Channel logic level enhancement mode power field effect transistors are produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on-state resistance. These devices are particularly suited for low voltage applications such as notebook computer power management, portable electronics, and other battery powered circuits where fast high-side switching, and low in-line power loss are needed in a very small outline surface mount package.

Features

- -1.2 A, -20 V, $R_{DS(ON)} = 0.27 \Omega @ V_{GS} = -2.7 \text{ V}$
 $R_{DS(ON)} = 0.2 \Omega @ V_{GS} = -4.5 \text{ V}$.
- Very low level gate drive requirements allowing direct operation in 3V circuits. $V_{GS(th)} < 1.0\text{V}$.
- Proprietary package design using copper lead frame for superior thermal and electrical capabilities.
- High density cell design for extremely low $R_{DS(ON)}$.
- Exceptional on-resistance and maximum DC current capability.
- Compact industry standard SOT-23 surface Mount package.

**Absolute Maximum Ratings** $T_A = 25^\circ\text{C}$ unless otherwise noted

Symbol	Parameter	NDS336P	Units
V_{DS}	Drain-Source Voltage	-20	V
V_{GS}	Gate-Source Voltage - Continuous	± 8	V

Notes:

1. R_{θJA} is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. R_{θJC} is guaranteed by design while R_{θCA} is determined by the user's board design.

$$P_D(t) = \frac{T_J - T_A}{R_{\theta JA}(t)} = \frac{T_J - T_A}{R_{\theta JC} + R_{\theta CA}(t)} = I_D^2(t) \times R_{DS(ON)} @ T_J$$

Typical R_{θJA} using the board layouts shown below on 4.5"x5" FR-4 PCB in a still air environment:

- a. 250°C/W when mounted on a 0.02 in² pad of 2oz copper.
- b. 270°C/W when mounted on a 0.001 in² pad of 2oz copper.
