

JUST FACTS.

SEIZE THE DATA

People's
Unfiltered
Media
Project

You are not in control of what you can see through social media and search engines. But there's a way to fix that.

Massive corporations that dominate the internet, like Google, Facebook, and Twitter, promote certain narratives while withholding key facts. As a result, We the People are left dangerously misinformed. We only see what they want us to see—distorted and biased snapshots of reality.

That is why Just Facts has launched the People's Unfiltered Media Project (PUMP): to harken back to a time when the whims of a few tech billionaires did not determine "truth." Our mission is to work around corporate censorship by physically putting facts in the hands of the American people.

To combat this misinformation, this latest edition of PUMP features facts about Covid-19 vaccines. The facts below come from the following primary sources:

- U.S. Food and Drug Administration
- Centers for Disease Control and Prevention
- National Institutes of Health
- Proceedings of the National Academy of Sciences
- JAMA Network Open
- BMJ Evidence-Based Medicine
- European Journal of Epidemiology
- American Statistical Association

Main Study Used by FDA to Approve Covid-19 Vaccine Found No Statistically Significant Effect on the Risk of Death

Buried 23 pages into its approval summary for Pfizer's C-19 vaccine, the FDA reveals that 38 people died in the primary trial for this vaccine, including 17 who received the placebo and 21 who received the vaccine. With 95% statistical certainty, this data shows that the vaccine could prevent up to one death or cause up to five deaths per year among every 1,000 people.

Those results are subject to limitations that could have been lessened if Pfizer and other vaccine manufacturers had not ejected participants from their most reliable studies after a maximum of six months. Yet, the manufacturers chose to do this in defiance of government healthcare regulatory agencies who recommended that the subjects be enrolled for at least one year.

The situation with young children is even murkier because Pfizer is using a less exacting type of study that enrolled only 2,268 children. This is fewer than 99% of the 400,000+ children who were enrolled in the main study for the polio vaccine. Based on this methodologically uncertain and statistically underpowered evidence, an FDA committee is meeting on October 26, 2021 to consider authorizing the use of this vaccine in children aged 5 to 11.
